Playable work: 8-ball pool · CrazeOh (Three.js) · Architect Engine (WebGPU)

PROFILE

Software engineer with eight years of experience building interactive web applications, browser games, and real-time graphics. Work spans React/TypeScript products, custom rendering and gameplay systems, UI/UX design, and Node.js/AWS services. Comfortable taking projects from design through implementation, collaborating across disciplines, and mentoring developers.

CORE SKILLS

Web & data: TypeScript, React, Node.js, Vue.js, PostgreSQL, MongoDB, GraphQL, Sanity
Games & graphics: Three.js, WebGL, WebGPU, Unity/C#, Cocos Creator, real-time networking
Product & delivery: UI/UX design, Figma, CSS/Tailwind, AWS, Docker, Python, CI/CD
Technical leadership: software architecture, developer mentoring, gameplay/content tools

PROFESSIONAL EXPERIENCE

HEALTH | Freelance Software Engineer

Apr–Nov 2024; Jul 2026–Present

- Designed and built HEALTH's original membership launcher, then returned to redesign the platform with a searchable media library, audio playback/downloads, and personalized accounts.
- Developed passwordless login, content administration and media-processing tools, and Patreon/Discord integrations using React, TypeScript, Node.js, and AWS.
- Implemented automated membership reconciliation to maintain patron access and Discord roles when Patreon webhooks became unreliable.

Amihan Entertainment | Game Developer (Contract)

Feb 2025–Sep 2025

- Returned as a consultant for the Farm Frens mobile-game rewrite, frontend performance, and WebGL development.
- Shipped four mobile HTML5 minigames in Cocos Creator, with custom sprite/UI shaders. Reduced bundle size by approximately 20% and initial load times by up to 50% through asset compression and deferred loading.

Kraken | Frontend Web Developer

Aug 2024–Feb 2025

- Contributed to marketing-site publishing workflows and internal CMS authoring tools using React and Tailwind.
- Worked on learning-center technical SEO and schema markup; helped frontend colleagues improve code quality.

Amihan Entertainment | Game & Full-Stack Development

Jan 2021–May 2024

- Contract full-stack engineer, Jan–May 2021; full-time game developer, May 2021–May 2024. Worked on SnickSnack, Everseed, and browser-game research.
- Led engineering of a native WebGL game-engine prototype; mentored developers on ECS and component-based architecture. Built gameplay systems, UI, and visual scripting/content tools.
- Built React sites, game integrations, and payment flows; led a WebAssembly port and browser/Android integration.

Freelance | Web & Desktop Development

Oct 2018–Jan 2021

- Built Electron publishing and launcher tools for Stardust and Aeternum, browser-automation interfaces for Aestell, and full-stack features for Fwdslash.
- Developed subscription dashboards, payment integrations, and real-time interfaces; tutored developers in frontend and basic backend development.

Portfolio · poisonapple.dev

SELECTED PROJECTS

8-ball pool

TypeScript · Three.js · WebSockets · Playwright

Playable browser demo

- Built a browser-based 8-ball pool prototype with a custom billiards simulation, 3D rendering, shot-searching bots, and relay-backed multiplayer.
- Separated simulation, rules, rendering, and networking; implemented command replay, state hashing, and reconnect recovery to support multiplayer consistency.
- Localized the game into 21 languages across 25 locales, with automated UI and visual regression testing for layout, text scaling, and interactions.

HEALTH+

React · TypeScript · Node.js · AWS · Electron · Figma

Live product · Portfolio and screenshots

- Redesigned the product and interface around a searchable media library, audio playback/downloads, and personalized accounts with badges, stats, and unlockables.
- Built backend services and passwordless authentication alongside content administration and media-processing tools.
- Integrated Patreon membership data and Discord roles, with automated reconciliation to keep access consistent despite unreliable upstream webhooks.

Architect Engine

TypeScript · WebGPU · ECS · Rapier physics · GLTF

Playable demo · Public source

- Developed a native WebGPU engine prototype with a deferred renderer, ECS-style state and Rapier physics.
- Built a GLTF asset pipeline using texture atlases and color-channel packing; developed rendering effects including palette quantization and dithering.

CrazeOh

Three.js · Custom postprocessing · 3D audio

Playable game

- Built the Three.js game experience, custom postprocessing and 3D audio, collaborating with Kemal Albayrak on level design.
- Released in June 2025, combining browser graphics, gameplay and audio integration.
