Hey, I'm Andres Sweeney-Rios

I'm a generalist software engineer from California. I work mostly in web development (fullstack), gameplay engineering, and realtime networking, but I also have an interest in tools development, web design, graphics programming, and audio programming.

Experience

AMIHAN ENTERTAINMENT (JAN 2021 — PRESENT)

SnickSnack (FULLSTACK WEB, GAMEPLAY)

This was a social MMO with various minigames, shops, outfits, and a snowglobe builder. I joined the team as a UI developer, and later worked on the backend and minigames, which were built in a mixture of web technologies & Unity. The alpha is still playable online.

Research Project (UI DEVELOPMENT, ART PIPELINE, GAMEPLAY)

After SnickSnack, we moved to a 3D browser game, where I led the engineering team to lay the foundations for our prototype's code architecture, UI systems, gameplay loop, and several different art experiments, running benchmarks and configuring our art pipeline.

Three.js | React | GLSL | JavaScript

Everseed (GAMEPLAY, TOOLS DEVELOPMENT, UI DEVELOPMENT, FRONTEND WEB)

We transitioned to a new roguelike tower defense prototype **Everseed**, where you grow plants to defend against enemy waves. My role on this project has been primarily in architecture, gameplay, and UI, with a focus on building tooling for the design team. We launched a closed playtest in May 2022, and the prototype is still in development.

Working with the art team, I also built the frontend for the Everseed Website, which included details about the project and previews for some of the early art.

Everseed NFT Launch (FRONTEND WEB)

In preparation for our first NFT launch, I worked with the art & engineering teams where I was responsible for developing the UI to create the **Everseed Elixir Website**, which was a digital shop where you could purchase what was known as an *elixir*. This would be consumed by the avatar creator when minting your avatar. Elixir sales on this website are now closed.

Shortly after, we also launched the **Everseed Avatar Creator**, a character customizer that required an elixir to mint a new avatar that would be attached to your account for the core game. I was again responsible for UI development mainly. The customizer portion of this website is still online and functional.

Phantom | React | JavaScript

FWDSLASH (SEPT 2020 — JAN 2021)

Rake.GG (FULLSTACK WEB)

I worked on this online crypto casino as a fullstack developer, responsible for interfacing with APIs such as Infura and BlockCypher for managing funds, integrating it with the frontend, and creating 3D visuals for the minigames.

Kubernetes | Bitcoin | Ethereum | WebSockets | Three.js | Vue | JavaScript

AESTELL (SEPT 2019 — FEB 2020)

AltX Bot Tools (FRONTEND WEB)

A set of tools used in automating the user's web browser. I joined an existing team to improve workflows and refactor code from previous frontend developers, and created new content utilizing SVG animations.

Electron | React | JavaScript

Supscript (FULLSTACK WEB)

I led the team building Supscript, a service to provide users with a way to receive notifications for new sales on limited items. I built a dashboard for this app, an admin panel, a subscription system, and various statistics pages.

Stripe | Vue | JavaScript

Emails.GG (FULLSTACK WEB)

Our team built a mailing client to manage numerous email addresses simultaneously, and to filter through them for important mail. I designed and wrote the frontend, and maintained the backend after release.

Vue | JavaScript

AETERNUM INDUSTRIES (JUNE 2019 — OCT 2019)

Firefight Launcher (FRONTEND)

I collaborated with various designers and game/systems engineers to build a desktop launcher for the Firefight game server, which would launch and configure the user's Minecraft client to load into the game.

Electron | Vue | JavaScript

STARDUST (OCT 2018 — NOV 2018)

Stardust Publisher Tools (FRONTEND)

Desktop client for Stardust publishers to allow posting video game assets to a blockchain for use in digital marketplaces. I designed the interface and developed the frontend for the app.

Electron | Ethereum | S3 | Vue | JavaScript
